

## Memobase Plus

At Pittcon 2012, Endress+Hauser Conducta is pleased to introduce Memobase Plus, a Windows-based PC software and database that integrates multiple methods of measurement and multiple measuring points with centralized control and data recording in a laboratory PC application. In Memobase Plus, reports are generated with calibration and measurement data providing an audit trail to comply with current and future regulatory agency requirements. Harnessing the advantages of intelligent sensor technology with the convenience of an easy to use PC application, Memobase Plus improves productivity, record keeping and repeatability when measuring pH, ORP, conductivity, dissolved oxygen, and chlorine in the laboratory environment.

You just need a PC (touch screen or keypad) to which the sensors are connected via a small box called MemoLink. This box transfers communication from the intelligent sensor to the USB port of your computer. Up to four sensors can be operated in parallel in Memobase Plus's multichannel and multiparameter measuring system. To learn more, visit Endress+Hauser Conducta at Pittcon 2012, booth #867
